

Welcome to the Tidy Tools Workshop!

1. Get connected to the wifi
`rstudio_conf / tidyverse`

2. Get the course materials
`usethis::use_course("http://rstd.io/tidy-tools")`

Doesn't work? Install latest
`usethis` from CRAN

3. Follow the instructions in **setup.R**

4. Stuck? Please ask for help!

Tidy tools

January 2018

Hadley Wickham
[@hadleywickham](#)
Chief Scientist, RStudio

Preliminaries

HELLO

my name is

Hadley

Lionel Henry
RStudio

Kara Woo
Datacamp

Your turn

This means that you
have to work!

This course is very hands on, and while we're here to help you, the best resource is often the person sitting next to you.

Introduce yourself to your neighbours. Who are you and what are you using R for?

Writing functions

Individual functions
to solve individual
problems

Designing APIs

Family of functions that
work together to solve
family of problems

Much of the course is drawn from existing books

<http://adv-r.hadley.nz/>

Working on 2nd ed

<http://r-pkgs.had.co.nz>

<https://amzn.com/1491910399>

<http://r4ds.had.co.nz>

<https://amzn.com/1491910399>

But the primary book does not yet exist

How R works

Tidy tools

Hadley Wickham

How to solve real
problems with R

Warmups

Don't expect to know all the answers!

Your turn

What are the four common types of **atomic vectors**?

(Bonus points for the two uncommon types)

What are the three properties of a vector?

```
typeof(TRUE)
```

```
typeof(1L)
```

```
typeof(1.5)
```

```
typeof("a")
```

```
# We'll talk about this (S3) later:
```

```
typeof(factor(1:10))
```

```
typeof(Sys.Date())
```

Every vector has three properties:

```
x <- 1:5
```

```
# 1. Type:
```

```
typeof(x)
```

```
# 2. Length
```

```
length(x)
```

```
# 3. Attributes
```

```
attributes(x)
```

```
# (we'll come back to those later)
```

Missing values

What does `NA == NA` return? Why?

What should you use instead?

There isn't a single unknown value

```
age_john <- NA
```

```
age_mary <- NA
```

```
age_john == age_mary
```

```
is.na(x)
```

Your turn

What are the six types of thing that you can put inside []?

blank

include all

integer

+ve: include

0: drop all

-ve: exclude

logical

keep TRUEs

character

lookup by name

Use character subsetting for simple look ups

```
x <- c("m", "f", "u", "f", "f", "m", "m")
```

```
lookup <- c(m = "Male", f = "Female", u = NA)
```

```
lookup[x]
```

```
unname(lookup[x])
```

Your turn

```
x <- rnorm(1e6)
pryr::object_size(x)
#> 8 MB
```

```
# How big will y be?
y <- list(x, x, x)
pryr::object_size(y)
```

```
# What if we change a value?
y[[1]][[1]] <- NA
pryr::object_size(y)
```

A name points to an object

There can be multiple references to an object

Modifying an object creates a copy

What happens after `rm(x)` and `rm(y)`?

First x and y are removed

Then the objects they point to

Until nothing is left

The direction of the arrow is important

A name “has” an object

An object doesn't have a name

RStudio

You don't have to use RStudio,
but if you do, try to master it!

Your turn

What's the shortcut for `<-` (assignment)?

What about `%>%` (pipe)?

How can you quickly comment a block of lines?

What are two ways to create multiple cursors? (Hint: google)
